The invention relates to the use of a glucagon-like peptide-2 (GLP-2) or its variant or homologue for suppressing appetite or inducing satiety. The GLP-2 has the generic formula: X1-H-X2-DGSFSDEMNT-X3-LD-X4-LA-X5-X6-DFINWL-X7-X8-TKITD-X9, in which: X1 is absent, or is the spacer peptide DFPEEVAIVEELGRR, DFPEEVTIVEELGRR, DFPEEVNIVEELRRR, or a fragment of these ; X2 = A or G; X3 = I or V; X4 = N, S or H; X5 = A or T; X6 = R or K; X7 = I or L; X8 = Q or H; and X9 is absent or is K, R, RK, RR or KK. These peptides have a powerful effect on inhibiting food intake when administered peripherally. It is thought that GLP-2 normally released from the intestinal L-cell together with GLP-1 also serves its own

Claim 1; Page 25; 34pp; English.

or its

distinct role as a peripheral satiety factor. The peptides may be used

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                for the prevention and treatment of disorders associated with impaired appetite regulation, specifically obesity and type II diabetes. The present sequence represents one of the spacer peptides in the above generic formula. (Updated on 17-OCT-2003 to standardise OS field)
                                                                                                      The invention relates to the use of a glucagon-like peptide-2 (GLP-2) or its variant or homologue for suppressing appetite or inducing satiety. The GLP-2 has the generic formula: X1-H-X2-DGSFSDENNT-X3-LD-X4-LA-X5-X6-DFINWL-X7-X8-TKITD-X9, in which: X1 is absent, or is the spacer peptide pppEKWAIVEELGRR, DFPEKWIVEELGRR, DFPEKWAIVEELGRR, DFPEKWAIVEELGRR, DFPEKWAIVEELGRR, DFPEKWAIVEELGRR, DFPEKWAIVEELGRR, OF A OT F, X6 = R OT K; X7 = I OT L; X8 = Q OT H; and X9 is absent or is K, R, RK, RR OT KK.

These peptides have a powerful effect on inhibiting food intake when administered peripherally. It is thought that GLP-2 normally released from the intestinal L-cell together with GLP-1 also serves its own distinct role as a peripheral satiety factor. The peptides may be used for the prevention and treatment of disorders associated with impaired appetite regulation, specifically obseity and type II diabetes. The prevent sequence represents one of the spacer peptides in the above
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             AAW35932 standard;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 15
                                                                                                                                                                                                                                                                                                                                                                               Using glucagon-like peptide(s) for appetite suppression and satiety induction - specifically by administering glucagon-like peptide-2, or derivatives with glucagon-like peptide-1; used to treat and/or prevent obesity and type II diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Thim L,

                                                                                                                  This polypeptide comprises an Arg52Ala mutant of human preproglucagon. The sequence can be expressed from a PCR- amplified mutated cDNA clone (see AAT75673). RIN rat insulinoma cell lines expressing preproglucagon provided efficient amidation of a secreted, processed polypeptide. The invention provides methods for production of heterologous polypeptides using recombinantly engineered cell lines. Also described are methods of engineering cells for high level expression, methods of large-scale heterologous protein production, and methods for treatment of disease in vivo using viral delivery systems and recombinant cell lines
                                                                                               Sequence 180
                                                                                                                                                                                                                                                                                Recombinant cell engineered to provide amylin to a mammal - useful to treat e.g. angiogenesis, anorexia, obesity, hypertension, osteoporosis
                                                                                                                                                                                                                                                                                                                    N-PSDB; AAT22081

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           expressed from a PCR-amplified cDNA clone (New Animology). Expressed from a PCR-amplified cDNA clone (New Animology). The involded efficient insulinoma cell lines expressing preproglucagon provided efficient amidation of a secreted, processed polypeptide. The invention provides methods for production of heterologous polypeptides using recombinantly engineered cell lines. Also described are methods of engineering cells for high level expression, methods of large-scale heterologous protein production, and methods for treatment of disease in vivo using viral delivery systems and recombinant cell lines
                                                                                                                                                              Amylin; production; secretory cell; blood glucose level regulation; diabetes mellitus; hypoglycaemia; osteoporosis; Paget's disease; hypercalcaemia; obesity; hypertension.
                                                                                                                                                                                                                                                                                                                                         17-JAN-2001
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 180 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This polypeptide comprises human preproglucagon. The sequence can expressed from a PCR-amplified cDNA clone (see AAT75672). RIN rat

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This invention relates to a method for producing mammalian amylin. The method relies on the use of a recombinantly engineered secretory cell line. The method comprises: (a) providing a starting secretory cell that can regulated secretory pathway; (b) introducing, into the starting secretory cell, an amylin-encoding gene operatively linked to a first production of biologically active amylin as compared to the starting secretory cell, and (d) culturing the selected secretory cell. Amylin is considered to the starting secretory cell; and (d) culturing the selected secretory cell. Amylin is an insulin modulator, and the method results in antidiabetic, hypotensive and osteopathic activity. The amylins produced are useful for regulating blood glucose levels, as well as in modulating the circulating levels of insulin in a mammal. The amylins produced maybe used in treating diabetes mellitus, hypoglycaemia, osteoporosis, Paget's disease, hypercalcaemia, obesity, hypertension, or any other disorder requiring amylin regulation. The invention includes cDNA and protein sequences (AAC55760 and AAB26777) representing human amylin. Sequences AAC55716-C55681 and AAB26765-B26777) regresenting human amylin. Sequences AAC55716-C55681 and AAB26765-B26777)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This invention relates to a method for producing mammalian amylin. The method relies on the use of a recombinantly engineered secretory cell line. The method comprises: (a) providing a starting secretory cell that the sare regulated secretory pathway; (b) introducing, into the starting conserved secretory cell, an amylin-encoding gene operatively linked to a first promoter; (c) selecting a secretory cell of (b) that exhibits increased production of biologically active amylin as compared to the starting conserved conserve
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This invention relates to a novel albumin fusion protein having albumin or biological activity. Human serum albumin is responsible for a significant proportion of the osmotic pressure of serum and also functions as a carrier of endogenous and exogenous ligands. The fusion of albumin to a therapeutic protein may increase shelf-life and stability of the therapeutic protein. The albumin fusion protein of the invention may allow production of compositions with antidiabetic activity whilst the nucleotide sequence which encodes it may be useful for gene therapy. The albumin fusion protein is useful for preparing a composition for treating diabetes meallitus. The present sequence is that of a therapeutic protein which was fused with human albumin to create a novel albumin fusion protein of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/publishedpct_sequences

                                                                                                                                                                                                This invention relates to a novel albumin fusion protein having albumin or biological activity. Human serum albumin is responsible for a significant proportion of the osmotic pressure of serum and also functions as a carrier of endogenous and exogenous ligands. The fusion of albumin to a therapeutic protein may increase shelf-life and stability of the therapeutic protein. The albumin fusion protein of the invention may allow production of compositions with antidiabetic activity whilst the nucleotide sequence which encodes it may be useful for gene therapy. The albumin fusion protein is useful for preparing a composition for treating diabetes mellitus. The present sequence is that of a therapeutic protein which was fused with human albumin to create a novel albumin fusion protein of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/publishedpct_sequences
                                                                                                                                                                          Sequence 180 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                 New albumin fusion protein, useful for preparing a composition for treating diabetes mellitus.
                                                                                                                                                                                                                                                                                                                                                                                                       Example
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Ballance DJ, Turner
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               23-DEC-2002; 2002WO-US040891

                                     This invention relates to a novel albumin fusion protein having albumin or biological activity. Human serum albumin is responsible for a significant proportion of the osmotic pressure of serum and also functions as a carrier of endogenous and exogenous ligands. The fusion of albumin to a therapeutic protein may increase shelf-life and stability of the therapeutic protein. The albumin fusion protein of the invention may allow production of compositions with antidiabetic activity whilst the nucleotide sequence which encodes it may be useful for gene therapy. The albumin fusion protein is useful for preparing a composition for treating diabetes mellitus. The present sequence is that of a therapeutic protein which was fused with human albumin to create a novel albumin fusion protein of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/publishedpct_sequences

This invention relates to a novel albumin fusion protein having albumin or biological activity. Human serum albumin is responsible for a significant proportion of the osmotic pressure of serum and also functions as a carrier of endogenous and exogenous ligands. The fusion of albumin to a therapeutic protein may increase shelf-life and stability of the therapeutic protein. The albumin fusion protein of the invention may allow production of compositions with antidiabetic activity whilst the
                                                                                                                                  New albumin fusion protein, useful for preparing a composition treating diabetes mellitus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    albumin fusion protein; albumin activity; human serum albumin; serum osmotic pressure; shelf-life; stability; antidiabetic;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        nucleotide sequence which encodes it may be useful for gene therapy. The albumin fusion protein is useful for preparing a composition for treating diabetes mellitus. The present sequence is that of a therapeutic protein which was fused with human albumin to create a novel albumin fusion protein of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/publishedpct_sequences

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               or biological activity. Human serum albumin is responsible for a significant proportion of the osmotic pressure of serum and also functions as a carrier of endogenous and exogenous ligands. The fusion of albumin to a therapeutic protein may increase shelf-life and stability of the therapeutic protein. The albumin fusion protein of the invention may allow production of compositions with antidiabetic activity whilst the nucleotide sequence which encodes it may be useful for gene therapy. The albumin fusion protein is useful for preparing a composition for treating diabetes mellitus. The present sequence is that of a therapeutic protein which was fused with human albumin to create a novel albumin fusion protein of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 albumin fusion protein; albumin activity; human serum albumin; serum osmotic pressure; shelf-life; stability; antidiabetic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Homo sapiens

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This invention relates to a novel albumin fusion protein having albumin or biological activity. Human serum albumin is responsible for a significant proportion of the osmotic pressure of serum and also functions as a carrier of endogenous and exogenous ligands. The fusion of albumin to a therapeutic protein may increase shelf-life and stability of the therapeutic protein. The albumin fusion protein of the invention may allow production of compositions with antidiabetic activity whilst the nucleotide sequence which encodes it may be useful for gene therapy. The albumin fusion protein for treating albumin fusion protein is useful for preparing a composition for treating diabetes mellitus. The present sequence is that of a therapeutic protein which was fused with human albumin to create a novel albumin fusion protein of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic former wifes at feat was obtained in electronic forms.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       albumin fusion protein; albumin activity; human serum albumin; serum osmotic pressure; shelf-life; stability; antidiabetic; gene therapy; diabetes mellitus; human.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This invention relates to a novel albumin fusion protein having albumin corbiological activity. Human serum albumin is responsible for a significant proportion of the osmotic pressure of serum and also functions as a carrier of endogenous and exogenous ligands. The fusion of albumin to a therapeutic protein may increase shelf-life and stability of the therapeutic protein. The albumin fusion protein of the invention may allow production of compositions with antidiabetic activity whilst the nucleotide sequence which encodes it may be useful for gene therapy. The albumin fusion protein is useful for preparing a composition for treating diabetes mellitus. The present sequence is that of a therapeutic protein which was fused with human albumin to create a novel albumin fusion protein of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/publishedpct_sequences

                                                                                                                                                                                                                                                                                                                                                         This invention relates to a novel albumin fusion protein having albumin or biological activity. Human serum albumin is responsible for a significant proportion of the osmotic pressure of serum and also functions as a carrier of endogenous and exogenous ligands. The fusion of albumin to a therapeutic protein may increase shelf-life and stability of
                                                                                                                                                                                                                     protein of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/publishedpct_sequences
                                                                                                                                                                                                                                                                  albumin to a therapeutic protein may increase shelf-life and stability of the therapeutic protein. The albumin fusion protein of the invention may allow production of compositions with antidiabetic activity whilst the nucleotide sequence which encodes it may be useful for gene therapy. The albumin fusion protein is useful for preparing a composition for treating diabetes mellitus. The present sequence is that of a therapeutic protein which was fused with human albumin to create a novel albumin fusion
                                                                                                                                                                                              Sequence 180 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New albumin fusion protein, useful for preparing a composition treating diabetes mellitus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             N-PSDB; ADF16348.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Ballance DJ,

This invention relates to a novel albumin fusion protein having albumin or biological activity. Human serum albumin is responsible for a corbiological activity. Human serum albumin is responsible for a corbicant proportion of the osmotic pressure of serum and also functions as a carrier of endogenous and exogenous ligands. The fusion of combining the fusion protein may increase shelf-life and stability of the therapeutic protein. The albumin fusion protein of the invention may callow production of compositions with antidiabetic activity whilst the cultive production of compositions with antidiabetic activity whilst the cultive production protein is useful for preparing a composition for treating concludes the sequence which encodes it may be useful for gene therapy. The albumin fusion protein is useful for preparing a composition for treating combines mellitus. The present sequence is that of a therapeutic protein composition was fused with human albumin to create a novel albumin fusion protein of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/publishedpct_sequences

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

-i-FUNCTION: Glucagon plays a key role in glucose metabolism and homeostasis. Regulates blood glucose by increasing gluconeogenesis and decreasing glycolysis. A counterregulatory hormone of insulin, raises plasma glucose levels in response to insulin-induced hypoglycemia (By similarity).

-i-FUNCTION: GLP-1 is a potent stimulator of glucose-dependent insulin release. Play important roles on gastric motility and the suppression of plasma glucagon levels. May be involved in the suppression of satiety and stimulation of glucose disposal in peripheral tissues, independent of the actions of insulin. May also regulate the hypothalamic pituitary axis (HPA) via effects on LH, TSH, CRH, oxytocin, and vasopressin secretion. Increases islet mass through stimulation of islet neogenesis and pancreatic beta cell proliferaton (By similarity).

-I-FUNCTION: GLP-2 stimulation, of islet neogenesis and pancreasic cell proliferation and decreased enterocyte apoptosis. The gastrointestinal tract, from the stomach to the colon is the principal target for GLP-2 action. Plays a key role in nutrient disposal stimulates intestinal assimilation through enhanced gastrointestinal function, as well as increasing nutrient disposal stimulates intestinal assimilation mathematical disposals stimulates intestinal sincreasing nutrient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                MEDIJINE=83167563; PubMed=6835407;

In the intestinal L cells PCSK1/PC1 liberates GLP-1, GLP-2, glicentin and oxyntomodulin. GLP-1 is further N-terminally truncated by posttranslational processing in the intestinal L cells resulting in GLP-1(7-37) GLP-1-(7-36) amide. The C-terminal amidation is neither important for the metabolism of GLP-1 nor for its effects on the endocrine pancreas (By

Endocr. Rev. 20:876-913(1999).

-i- FUNCTION: Glucagon plays a key role in glucose metabolism and homeostasis. Regulates blood glucose by increasing gluconeogenesis and decreasing glycolysis. A counterregulatory hormone of insulin, raises plasma glucose levels in response to insulin-induced hypoglycemia (By similarity).

-i- FUNCTION: GLP-1 is a potent stimulator of glucose-dependent insulin release. Play important roles on gastric motility and the suppression of plasma glucagon levels. May be involved in the suppression of satiety and stimulation of glucose disposal in peripheral tissues, independent of the actions of insulin. Have growth-promoting activities on intestinal epithelium. May also regulate the hypothalamic pituicary axis (HPA) via effects on LH, TSH, CRH, oxytocin, and vasopressin secretion. Increases islet mass through stimulation of islet neogenesis and pancreatic beta cell proliferaton (By similarity).

-i- FUNCTION: GLP-2 stimulates intestinal growth and up-regulates villus height in the small intestinal concomitant with increased crypt cell proliferation and decreased entercyte apoptosis. The gastrointestinal tract, from the stomach to the colon is the principal target for GLP-2 action. Plays a key role in nutrient homeostarias aphancing nutrient agesticates of the colon is the subspace of the colon is the sub
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   MEDLINE=86248118; PubMed=3755107; DOI=10.1016/0014-5793(86)81429-6; Seino S., Welsh M., Bell G.I., Chan S.J., Steiner D.F.; "Mutations in the guinea pig preproglucagon gene are restricted to specific portion of the prohormone sequence."; FEBS Lett. 203:25-30(1986).

Regulates blood glucose by increasing gluconeogenesis and decreasing glycolysis. A counterregulatory hormone of insulin, raises plasma glucose levels in response to insulin-induced hypoglycemia. Plays an important role in initiating and maintaining hyperglycemic conditions in diabetes.

-I-FUNCTION: GLP-1 is a potent stimulator of glucose-dependent insulin release. Play important roles on gastric motility and the suppression of plasma glucagon levels. May be involved in the suppression of satiety and stimulation of glucose disposal in peripheral tissues, independent of the actions of insulin. Have growth-promoting activities on intestinal epithelium. May also regulate the hypothalamic pituitary axis (HPA) via effects on LH, TSH, CRH, oxytocin, and vasopressin secretion. Increases islet mass through stimulation of islet neogenesis and pancreatic beta cell proliferaton. Inhibits beta cell apoptosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    X-RAY CRYSTALLOGRAPHY (3.0 ANGSTROMS) OF 53-81.
